

SealSubmit

A Walrus-Native Feedback & Form Ecosystem

PROJECT VISION

SealSubmit is a decentralized feedback engine built to solve the trust and data-ownership issues of traditional form platforms. By utilizing **Walrus Protocol** for large-scale blob storage and **Seal** for military-grade client-side encryption, SealSubmit provides a permissionless, censorship-resistant infrastructure for bug reports, feature requests, and surveys.

TECHNICAL ARCHITECTURE

Decentralized Persistence

Leverages Walrus Blobs to store form schemas (JSON) and high-volume media assets like video recordings and system logs.

Privacy-First Engineering

Sensitive user fields are encrypted via Seal SDK before hitting the network. Only the form creator holds the decryption keys.

KEY CAPABILITIES

- **Native Media Uploads:** Direct Walrus integration for seamless video bug reports and large screenshot attachments.
- **Dynamic Builder:** Customizable input types including Rich Text, Star Ratings, Checkboxes, and URL validation.
- **Private Admin Dashboard:** A secure management interface for teams to prioritize, tag, and annotate submissions.
- **Open Export:** Full interoperability with professional workflows via JSON and CSV data exports.

IMPLEMENTATION STACK

Layer	Technology	Primary Role
Frontend	Next.js 14, Tailwind CSS	High-performance UI & Dynamic Rendering
Storage	Walrus Protocol	Distributed hosting for Blobs and Media
Security	Seal SDK	End-to-End Encryption for PII
Identity	Sui Wallet	Cryptographic ownership & Admin access

"Born on Walrus. Secured by Seal. Owned by You."
